

SRON Netherlands Institute for Space Research

Frank Helmich, Principal Investigator for HIFI on behalf of the HIFI consortium

Netherlands Organisation for Scientific Research

Overview

- The instrument
- Scientific capabilities
- Current status
- The LCU anomaly
- Way forward

Prof. Dr. Thijs de Graauw looking at the truck (with HIFI in it) on its way to Friedrichshafen Early July 2007

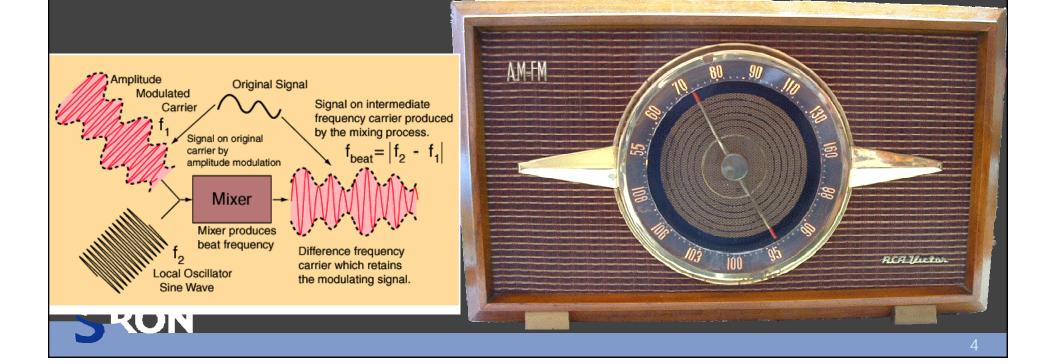

HIFI – Heterodyne Instrument for the Far-Infrared

- HIFI is a high resolution spectrometer –resolutions range from 120 kHz (High Resolution Spectrometer) to 1MHz
- 0.1 km/s even at lowest frequencies
- Frequency range is 480-1250 GHz and 1410-1905 GHz
- 14 LO chains needed to cover the wide frequency range
- Intermediate frequency range is 4 GHz in lowest bands; 2.4 GHz in highest bands
- SIS mixers in lowest bands; HEB in highest
- Mixer noise less than 3hv/k
- Single pixel on the sky but in two polarizations and with maximum 4096 channels
- Angular resolution 11-40"

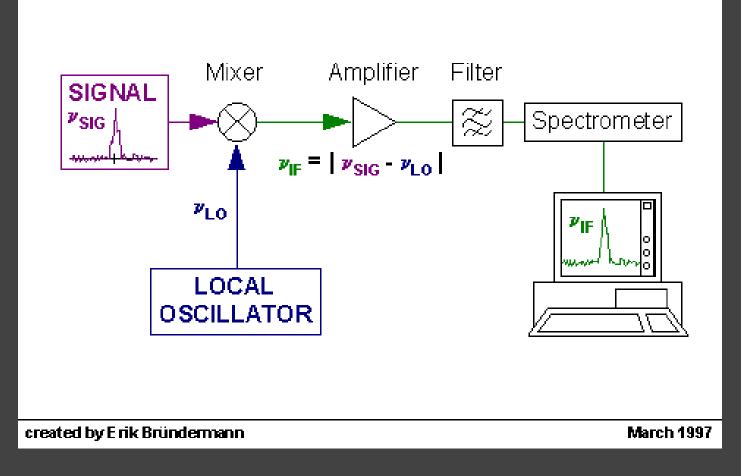

The heterodyne principle – mixing light

- We mix the sky signal with an ultra-stable local signal such that the difference frequencies can be detected
- This difference signal can be electronically amplified and analysed
- The difference signal contains all information of the sky signal

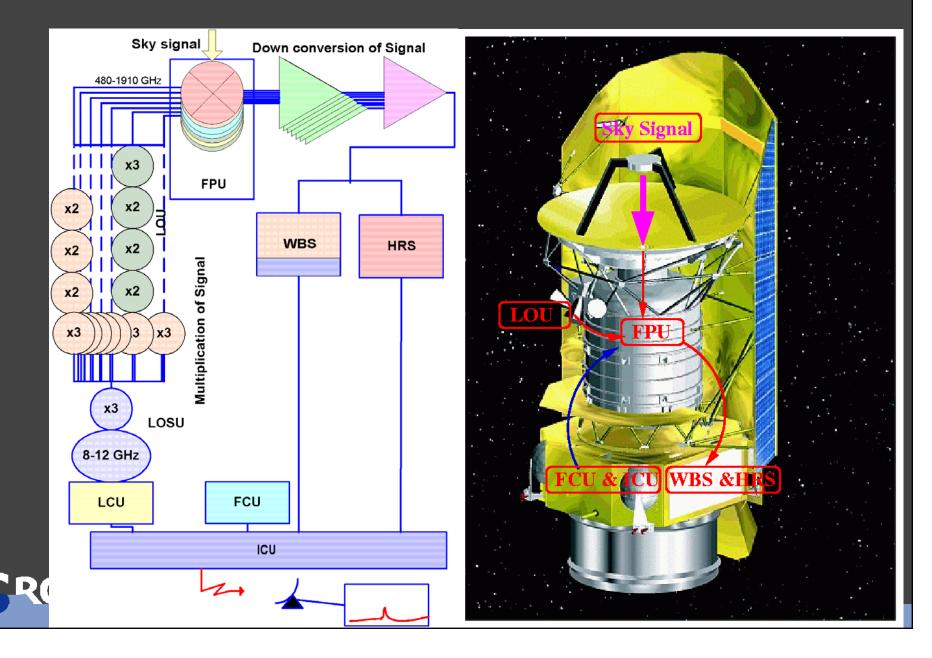

Heterodyne Spectroscopy

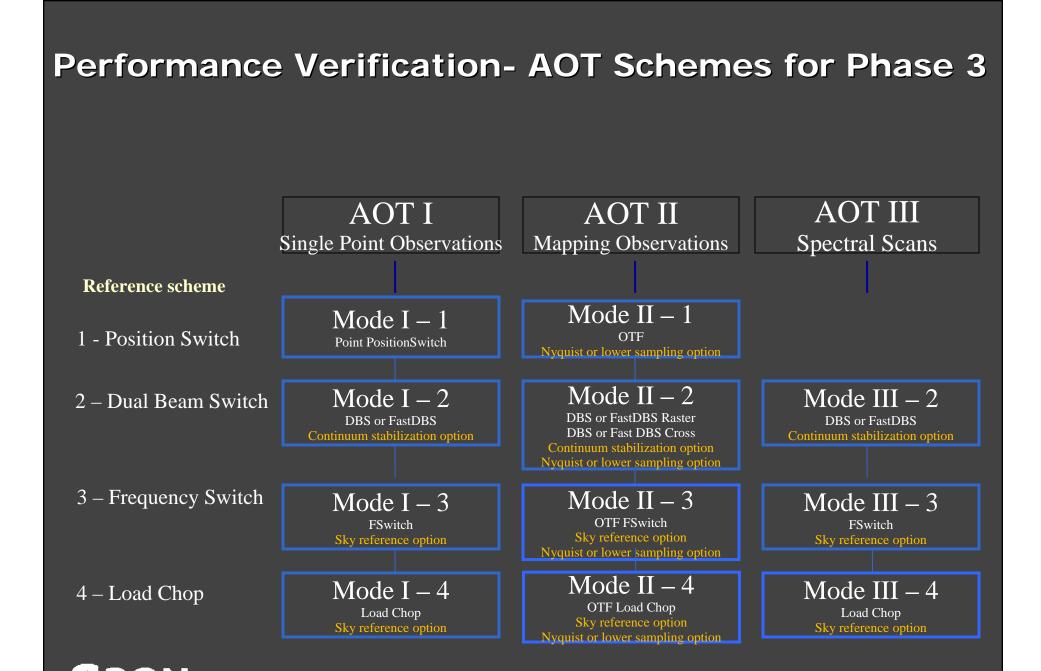

Heterodyne principle in Herschel

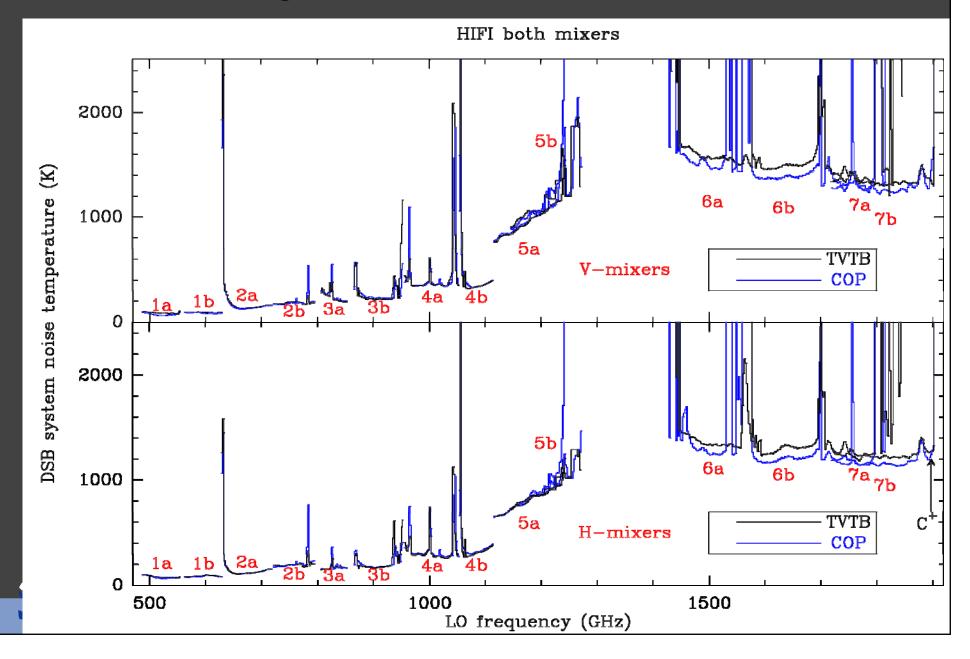

Observing modes

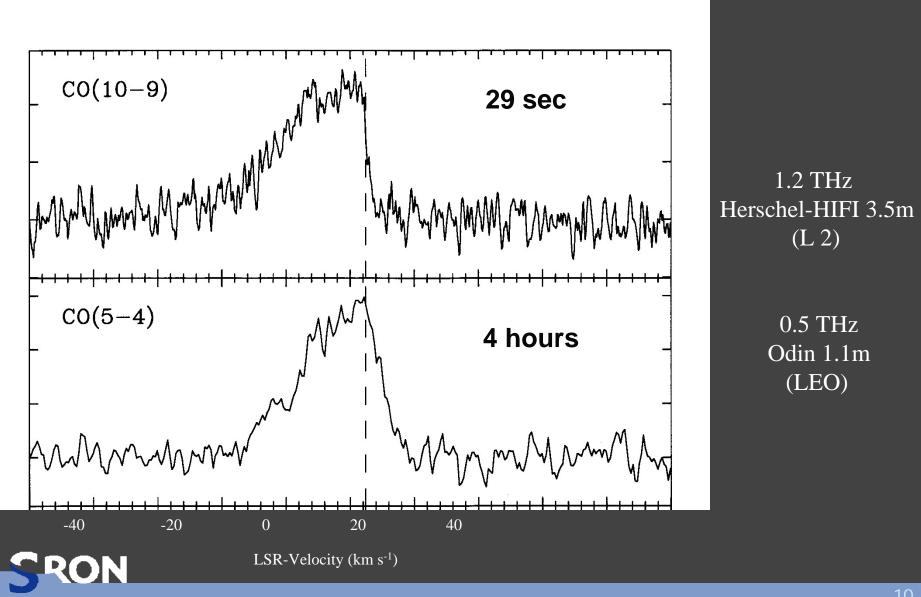

- HIFI uses standard observing techniques, as proven on groundbased observatories
- Generally a REFERENCE is needed:
 - REFERENCE can be a different direction (on the sky or on the load)
 - REFERENCE can be a slightly different frequency
- The difference signal takes out instrumental peculiarities
- For fixed pointings the Double Beam Switch (double difference) is the workhorse mode; frequency switch comes second
- In mapping On-The-Fly (OTF) is the main mode, followed by the raster scan

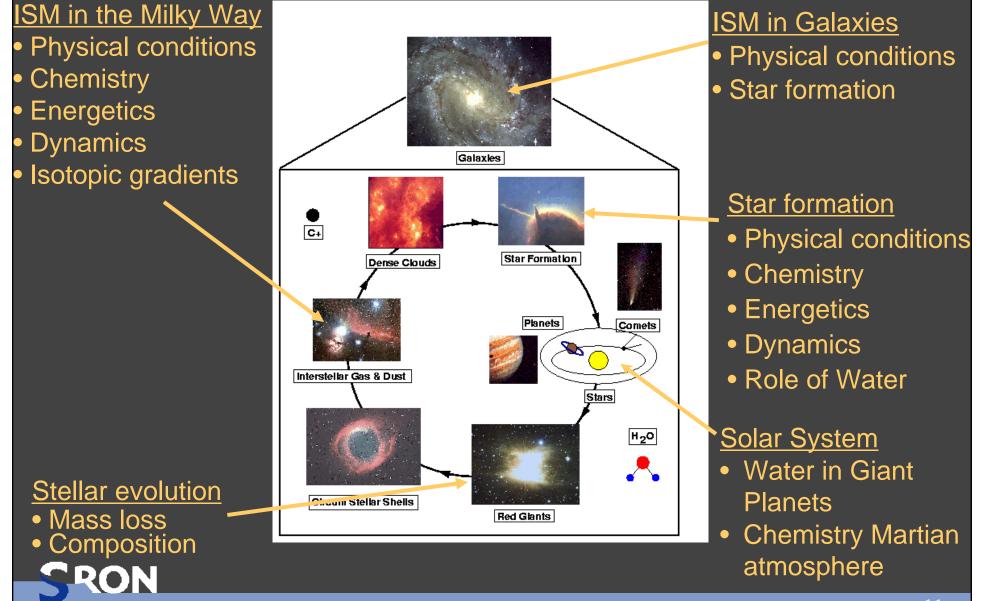

HIFI sensitivity

The life-cycle of gas and dust in galaxies

Science capabilities - Water

- Water can be used as • chemical and physical filter to probe many different temperature and density regimes
- Line profiles carry this ٠ information

HIFI in pictures

The anomaly

was 0.36A

- In OD81 at DTCP (August 3rd) HIFI was found with unknown LO status '14'
 - Change had occurred at 22:45z
 - HIFI LCU current had dropped to from 2.5A to 0.36A
 - Panel temperatures were dropping
 - HK for the LO subsystem contained many invalid values
 - No communication ICU-LCU
 - Restart (10th August) only restored communication, current

The LCU anomaly - history

- Timeline of events
 - 2nd August anomaly HIFI team starts research
 - End August ESA senior investigation team starts
 - End September basic scenario uncovered
 - October scenario refinement, design mitigating measures
 - November full implementation and validation

A big Thank You to all involved in the investigation

- Teams involved
 - HIFI research team ~ 20 persons (HIFI consortium)
 - ESA senior investigation team ~ 10 persons
 - HIFI steering committee review team 4 external specialists
- Review process
 - Thursday 26 November ESA briefing
 - Monday 30 November HIFI internal review1st week December switch-on readiness review (telecon)

Anomaly scenario

- 1. A single event upset corrupted the LCU memory.
- 2. Bit-flip brought the micro controller in non-communicado condition
- 3. Micro controller jumped to an erroneous program location

 \rightarrow executed program code not meant for use during normal operation

4. After 1.6 sec. standby relay was switched

 \rightarrow unit went instantly from full operational to standby

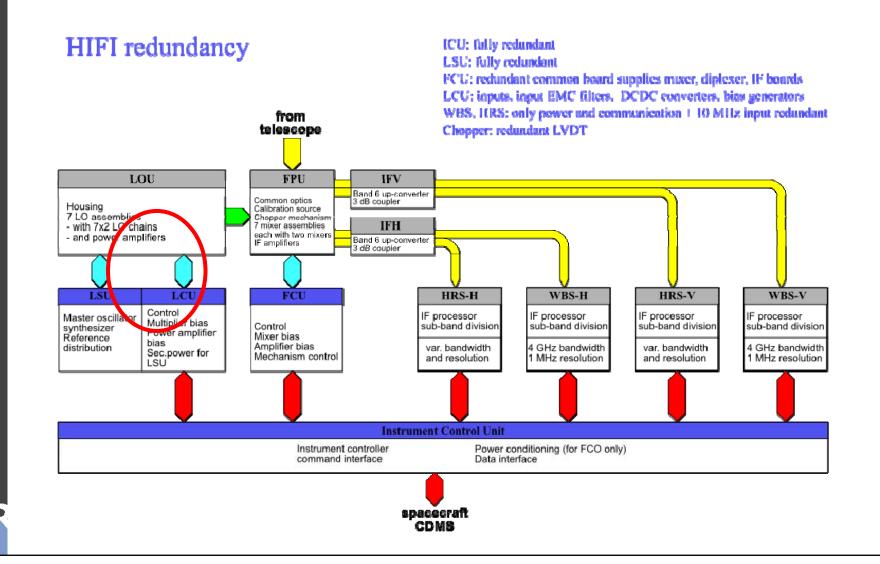

- 5. Power drop generates voltage transient on the internal 28V bus
 →fatal for a secondary rectifier diode in HRS4 DC/DC converter
- 6. End result:
 - instrument in stand-by
 - no LCU-ICU communication
 - LCU drawing ~0.36A (nominal is 2.8A)
 - significantly decreased power dissipation → unit/panel temperature drop

Important note; NO other scenario explains all observed

behavior

HIFI units/redundancy

•

The Priority Science Programme

The Science User Requirements Documenet defines HIFI's unique science:

- HIFI is a versatile instrument
- Water lines to probe the role of water in the physics and chemistry in the Universe
- Unbiased spectral line surveys which will provide a new view of the molecular inventory and the physical conditions in space
- In addition:
 - Biased spectral surveys to probe chemistry
 - Atomic fine structure lines (CII/NII) to probe the ISM of galaxies, in particular the dynamical aspects
- The PSP is ~400 hours of HIFI unique observations largely selected from the GT & OT KPs
- PSP is fundamentally a rescheduling issue

Way forward – PV and PSP

- December 6/7: switch-on of redundant ICU and FCU plus HRS-V and WBS-V; upload of new OBSW; switch-off of HIFI
- January 10-12: Switch on of HIFI; temperature stabilization of the LO S/S; Short Functional Test on LO; Re-commissioning i.e commisioning of the redundant electronics
- Middle of January: start of Performance Verification
 - Emphasis on Double Beam Switch modes
 - Release of DBS modes
- End of January: start of the Priority Science Programme
- February/March:
 - Release of OTF mode and rest of PV
 - Priority Science Observations
- April onwards: PSP-II or Routine observations

Conclusion I thank • hardwa e than 300 m Antenna temperature I thank nmes ٠ and th is I thank ng ٠ this ha I wish the • HIFI $1.9005 \ 10^{6}$ $1.9000 \ 10^{6}$ $1.9010 \ 10^{6}$ $1.9015 \ 10^{6}$ Frequency [MHz] Integration at DR21 Main (central position) Integration at OFF position (180" to the west)
